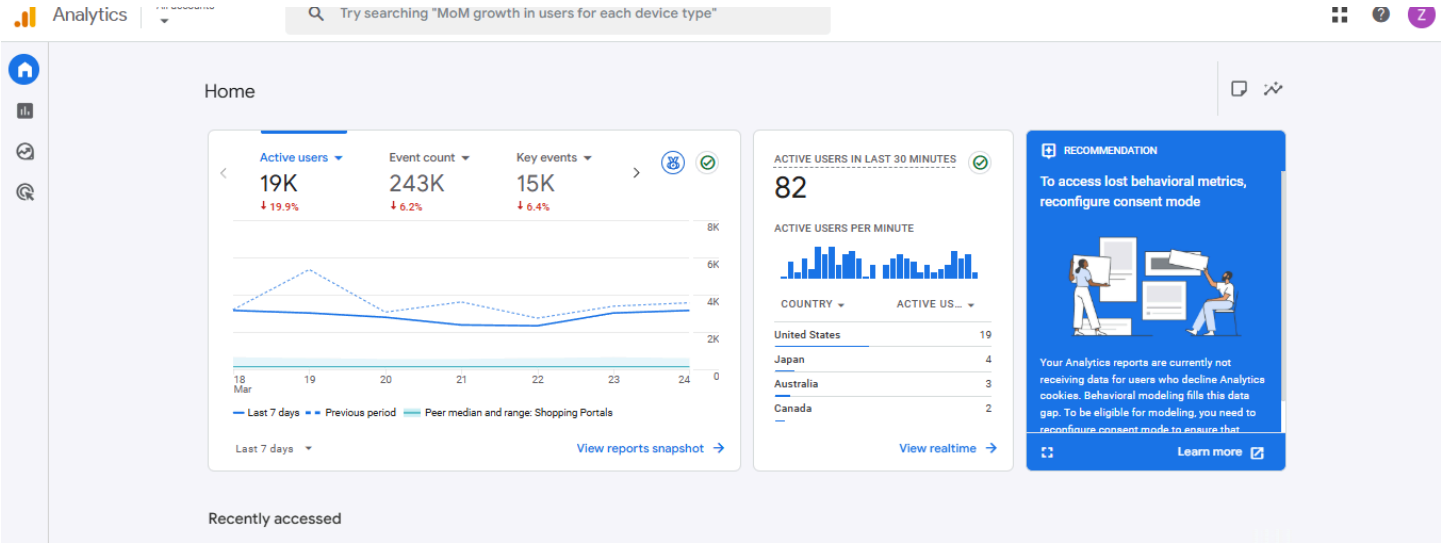
GA4 Exploration – Major Assignment Part 2

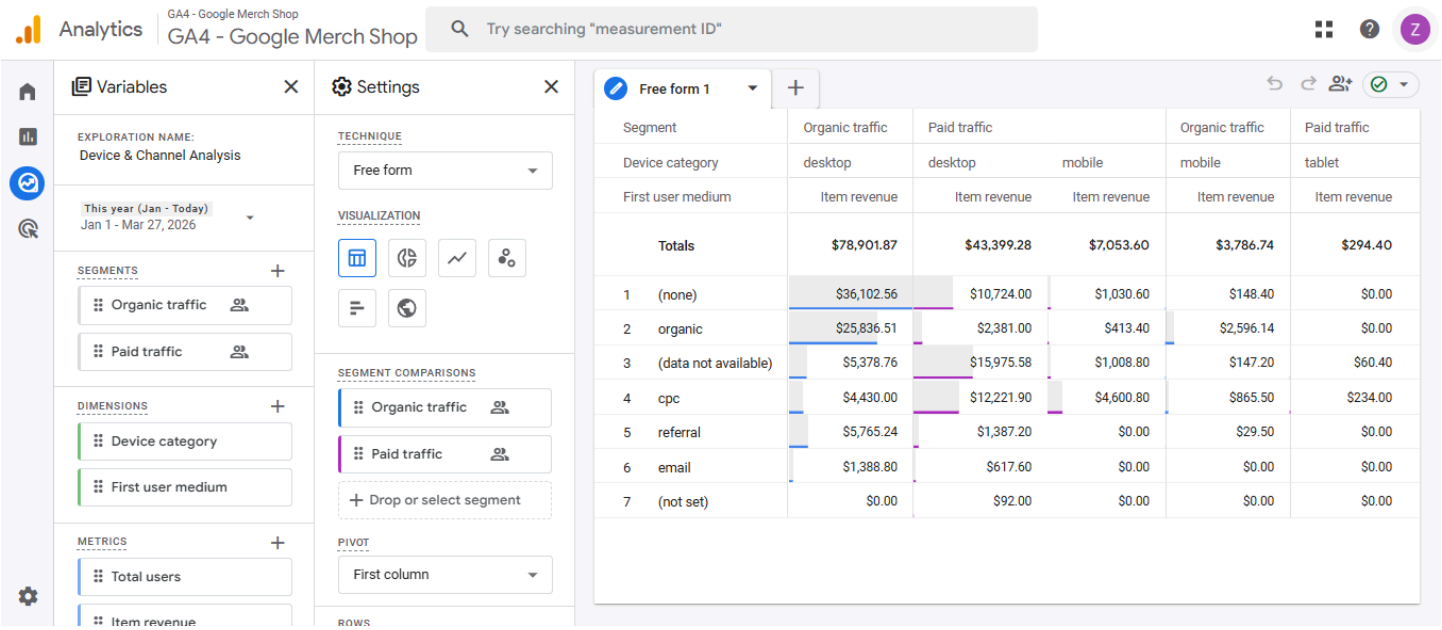
Name: Jarif Ahmed

Course: Google Analytics

Date: Friday, 27 March 2026



Free Form Exploration

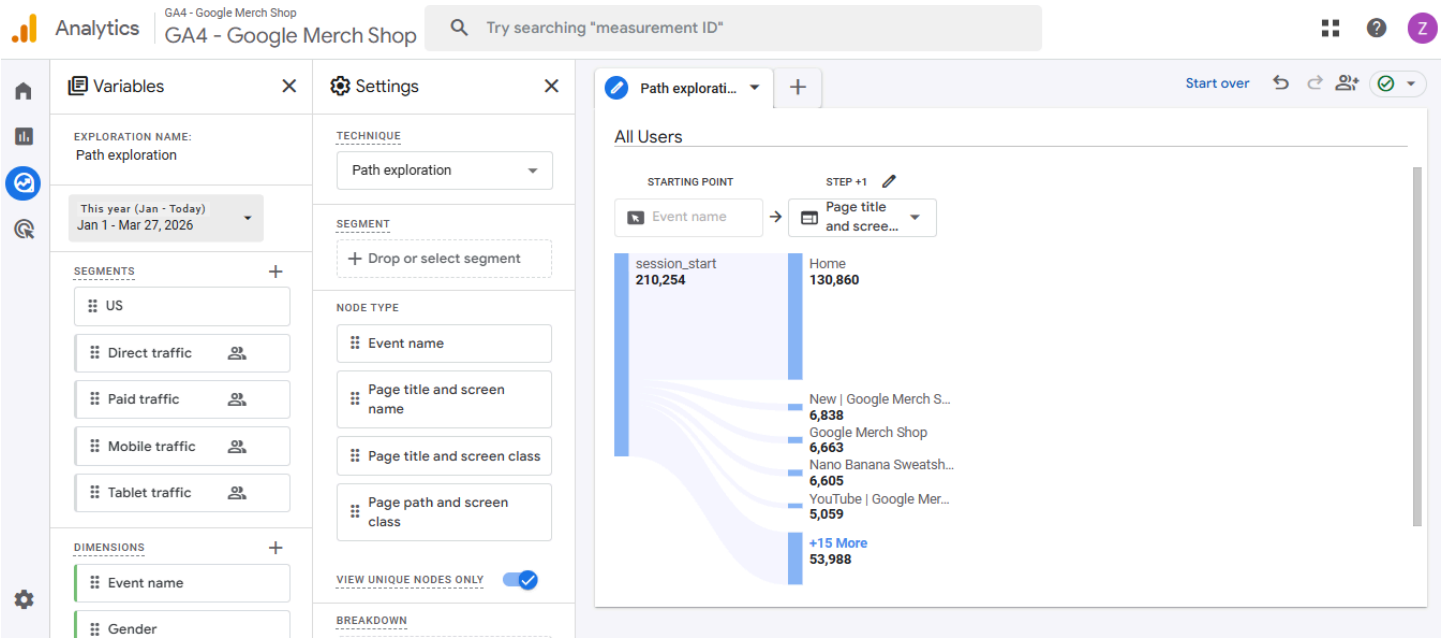


Segment		Organic traffic	Paid traffic		Organic traffic	Paid traffic
Device category		desktop	desktop	mobile	mobile	tablet
First user medium		Item revenue	Item revenue	Item revenue	Item revenue	Item revenue
	Totals	$78,901.87	$43,399.28	$7,053.60	$3,786.74	$294.40
1	(none)	$36,102.56	$10,724.00	$1,030.60	$148.40	$0.00
2	organic	$25,836.51	$2,381.00	$413.40	$2,596.14	$0.00
3	(data not available)	$5,378.76	$15,975.58	$1,008.80	$147.20	$60.40
4	cpc	$4,430.00	$12,221.90	$4,600.80	$865.50	$234.00
5	referral	$5,765.24	$1,387.20	$0.00	$29.50	$0.00
6	email	$1,388.80	$617.60	$0.00	$0.00	$0.00
7	(not set)	$0.00	$92.00	$0.00	$0.00	$0.00

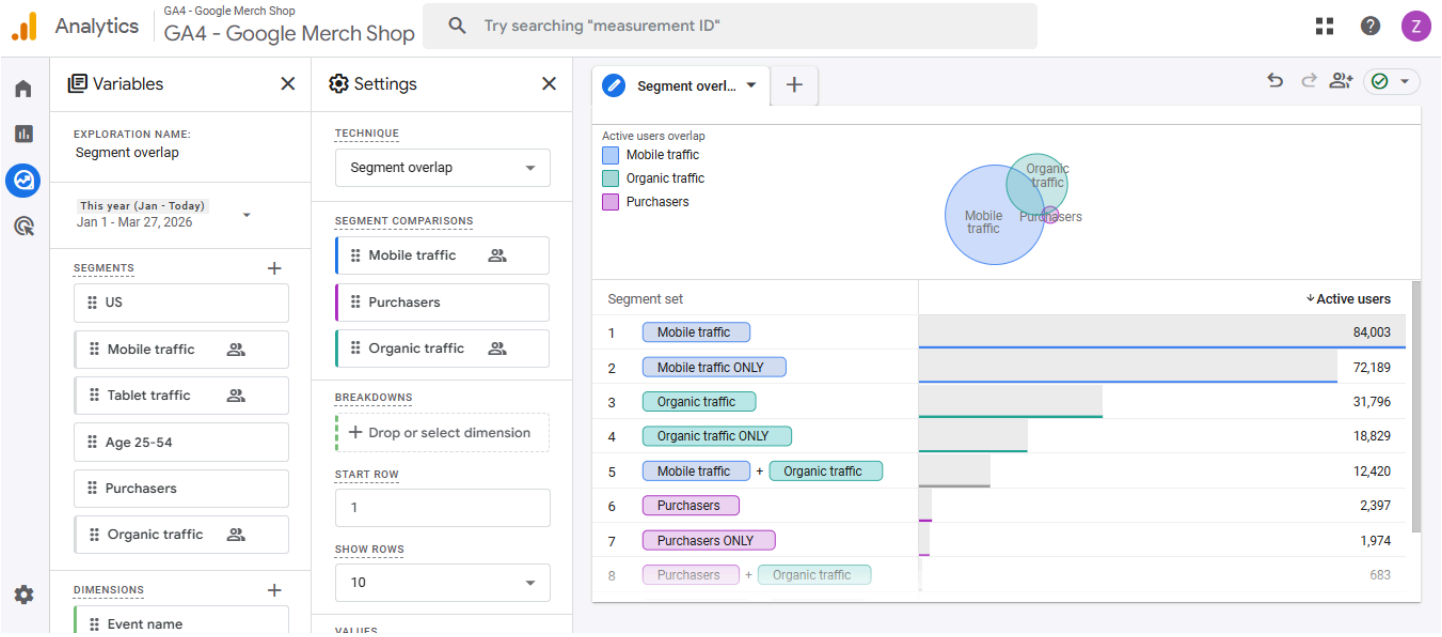
Funnel Exploration

	Step	Device category	Active users (% of Step 1)	Completion rate	Abandonments	Abandonm
1	Session start	Total	151,828 (100.0%)	21.96%	118,480	78.(
		desktop	69,679 (100.0%)	35.53%	44,923	64.4
		mobile	79,751 (100.0%)	10.47%	71,398	89.5
		tablet	783 (100.0%)	31.29%	538	68.7
		smart tv	8 (100.0%)	12.5%	7	87

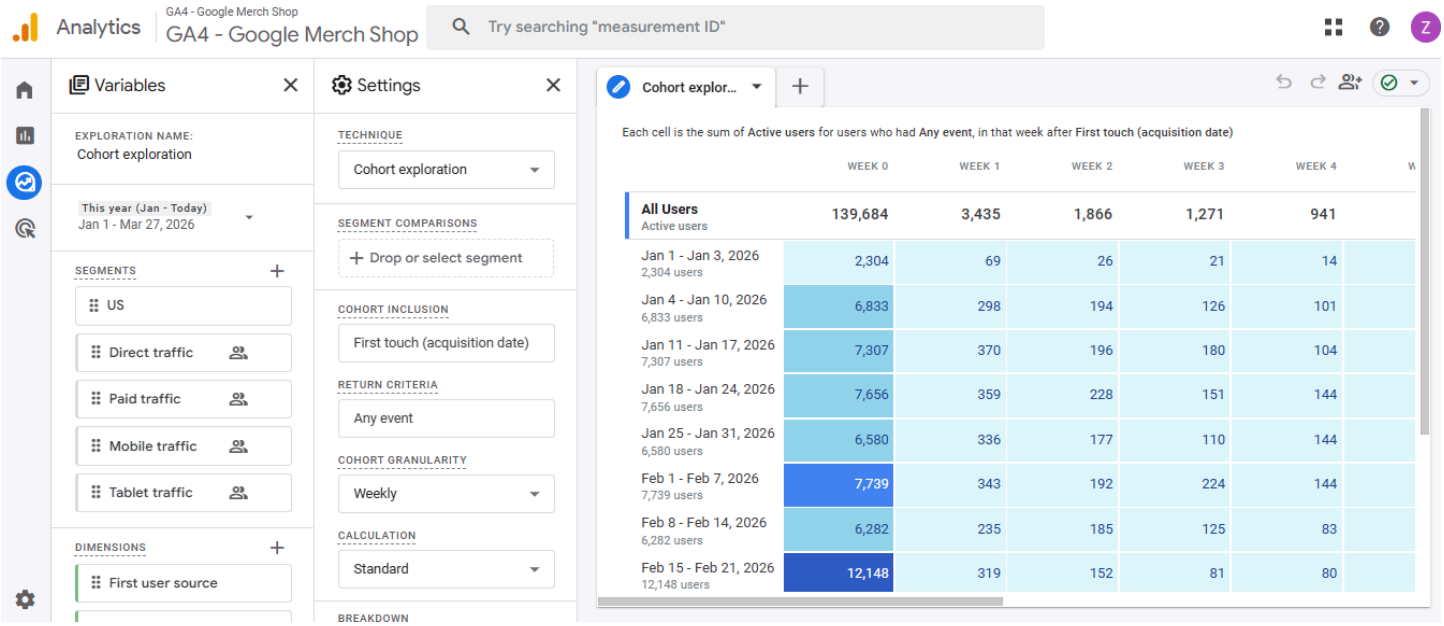
Path Exploration



Segment Overlap



Cohort Exploration



After analyzing the Google Merchandise Store using different GA4 exploration techniques, several important insights about user behavior, conversion performance, and retention became clear.

The biggest strength, or “Big Win,” is the performance of desktop users, especially those coming from organic traffic. Desktop consistently generates the highest revenue compared to mobile and tablet devices. This suggests that users on desktop have a smoother browsing and checkout experience, making them more likely to complete purchases. In addition, organic traffic appears to bring in users with stronger intent, meaning they are actively searching and are more ready to buy. As a result, the combination of organic traffic and desktop is the most valuable and high-performing segment for the store.

The main issue, or “Leak,” occurs at the very beginning of the user journey. Based on the funnel exploration, a large percentage of users drop off between Session Start and Product View. This means that many visitors leave the site without even viewing a product, which represents a major loss in potential revenue. The path exploration also supports this finding, showing that some users navigate to pages that are not directly related to shopping, such as YouTube pages, instead of continuing through the purchase journey. This early drop-off indicates that the website is not effectively guiding users into the shopping experience.To improve performance, two key strategies should be implemented. First, the mobile user experience should be optimized. Mobile users show significantly higher drop-off rates and lower conversion compared to desktop users, suggesting issues with usability, speed, or checkout flow. Improving mobile design, simplifying navigation, and making the checkout process easier can help reduce friction and increase conversions. Second, the business should focus on retention by introducing a win-back email campaign. The cohort analysis shows that very few users return after their first visit, which limits long-term growth. Encouraging users to return through targeted emails or incentives can help improve retention and increase overall customer lifetime value.Enhancing mobile UX and retention will minimize drop-offs and increase conversions.
